

 **Shutgun** *shuts off fire sprinklers fast!*

Water damage from fire sprinklers can cause costly damage...

... Shutgun stops water damage fast!

“ *Every sprinkler cabinet should have at least one Shutgun ready for use.*

We carry one in every truck -

Trent Elyea, Fire Chief

”

What is the Shutgun?

Shutgun is a tool designed to shut off activated fire sprinkler heads instantly. The lightweight and durable design makes it safe and easy to use one handed.

Designed by experienced fire fighters, it incorporates a unique fusible link that automatically releases the Shutgun if a fire rekindles

How does it work?

Whilst fire sprinklers are essential, Shutgun allows you to minimise costly water damage simply, safely and swiftly by acting as a temporary stopper. Fire sprinklers release on average 341 gallons of water per fire at a rate of 50-100 litres per minute. During this time water is damaging the property and services cannot resume. The Shutgun jaws are opened to seal an individual sprinkler head. With Shutgun in place the system returns to normal pressure and can be back online while awaiting service personnel. You can begin immediate clean up operations and reduce business downtime. It makes economic sense to ensure that Shutguns are readily available on every floor to prevent excessive damage to property and content.

Why have a Shutgun?

Students on campus are messing around and set off a fire sprinkler by accident. A construction worker knocks into a sprinkler head and water pours into a new build. An office fire is quickly controlled and extinguished but the water is still flowing.

Any of these events can cause costly water damage without a Shutgun on hand. Why waste precious time and money when a sprinkler can be shut off immediately until specialists arrive to fix it?
